Delivering Data-Driven Health Care, Door-to-Door

KENYA FACT SHEET
January 2022

Since 2015, Living Goods has worked closely with Kenya’s Ministry of Health (MOH), county-level governments, and their partners to strengthen community-based primary health care. We support and advocate for more robust community health programs through various systemwide strengthening approaches that help accelerate the attainment of universal health coverage (UHC).

The Problem

In Kenya, there is just one doctor for every 5,000 people. Many families still lack access to quality and affordable essential health services close to them. Vulnerable populations like pregnant mothers and children under five years are often disproportionately affected, given fewer than 62 percent of births are managed in a health facility, and 52 out of every 1,000 children die before their fifth birthday.

Decentralization of the health system in Kenya is enabling greater access to health services with a growing national focus on achieving UHC by 2030. However, each of the 47 counties faces various challenges in designing and implementing robust and sustainable health systems have adequate and effective health workforces. In addition, limited international funding and domestic investments for health; reliance on manual, disparate health data systems; and the absence of comprehensive primary health legislations has further compounded existing challenges within Kenya’s public health sector.

The Solution

Community health provides a low-cost and high-impact solution to these challenges and is globally recognized as a key pillar for UHC attainment. By leveraging well-equipped and enabled community health workers, known in Kenya as community health volunteers (CHVs), community health ensures a continuum of care for vulnerable populations and that every household has access to a range of promotive, preventive, and curative health services.

2021 Impact

(Cumulative annual data as of December 2021)

2,129
ACTIVE CHVs

22,135
NEW PREGNANCIES REGISTERED

1,197,610
PEOPLE SERVED

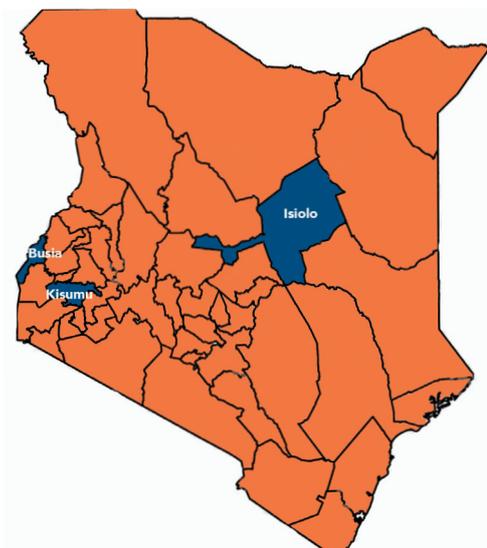

73,334
SICK CHILDREN UNDER 1 ASSESSED

314,013
SICK CHILDREN UNDER 5 ASSESSED

Every shilling invested in community health yields a return of up to KES 9.4 in socio-economic benefits.

- Kenya MOH Community Health Investment Case

Supporting Sustainable and Government-Led Digitized Community Health Systems in Kenya

We are doubling down on efforts to drive system-level change by supporting the Kenyan government to sustainably operationalize, digitize and finance its community health systems at scale. We provide implementation support to governments at national and county levels and advocate to influence government policy and action to prioritize community health investments and broad adoption of the DESC approach to effectively support community health workforces. We are partnering with the Kenyan government in the following ways:

Providing technical support to government to operationalize its eCHIS platform for community health.

Digitizing community health through the development of a robust, interoperable and comprehensive electronic community health information system (eCHIS) is one of government's priorities as part of far-reaching health sector reforms to achieve UHC and enhance data use at all levels. Working alongside other partners, we contributed to the development of a costed strategy for eCHIS, curricular and the co-design and enhancement of the eCHIS prototype that was modelled off of the LG Smart Health app. Living Goods is now a lead partner in providing technical support for government-led pilot of eCHIS in Kisumu County, which will inform phased scale up nationally.

Beyond the eCHIS pilot, we will support government in scaling up eCHIS beginning with over 3,000 CHWs in Kisumu and Isiolo where we already have existing co-financed partnerships for community health, to providing light-touch support to an additional 24,000 CHWs by 2026. When fully operationalized, eCHIS will encompass more than 95,000 CHWs across the country to drastically improve health outcomes and optimize the performance of CHW workforces.

Strengthening delivery through learning sites:

Working with Busia County government, we are implementing high-quality, cost-effective community health care using the DESC approach in learning sites to bolster innovation and showcase the best of what's possible in community health. As such, Busia remains the one Kenyan county where Living Goods will continue directly investing in community health to strengthen service delivery and generate local evidence for broader adoption of best practices in community health.

Strengthening the enabling environment:

We will also partner with national and county governments to accelerate the enabling environment for DESC-enabled community health by supporting the development and operationalization of foundational policies, practices, costing, and financing needed to sustain effective community health services at the national and county levels.

Living Goods' DESC approach effectively empowers CHWs and strengthens community health systems.
